(54) Long wear cosmetics.

(57) A composition adaptable for use as a long wear cosmetic or cosmetic base containing a pentaerythritol tetra (C₂₀-C₂₄) aliphatic hydrocarbon carboxylate, particularly pentaerythritol tetrabehenate is disclosed. Various uses of the compositions of the invention, e.g., as long wear eye cream, long wear eye stick, a long wear foundation, a long wear lipstick or lip cream, or as a long wear eyeliner or mascara are also disclosed.

LONG WEAR COSMETICS

This invention is a composition adaptable for use as a long wear cosmetic or cosmetic base. The long wear compositions of this invention are useful as foundations, eye creams, eyeliners, eyesticks, mascaras, lipsticks and lip creams.

As used throughout the present specification and claims the term "conventional" as an adjective defining a cosmetic, cosmetic base, or other composition is intended to mean a composition that does not contain pentaerythritol tetra ($C_{20}-C_{21}$) aliphatic hydrocarbon carboxylate.

The compositions of this invention contain from about 2 to about 25 weight percent of a pentaerythritol tetra ($C_{20}-C_{24}$) aliphatic hydrocarbon carboxylate in conventional cosmetic or cosmetic base compositions. This invention is based on the finding that the pentaerythritol tetra ($C_{20}-C_{24}$) aliphatic hydrocarbon carboxylate provides surprising and highly desirable long-wear properties to make-up compositions.

The compositions of this invention may be formulated as a long wear eye cream, eyeliner, eyestick, foundation, lipstick, lip cream or mascara. The present invention also provides a method for extending the effective wear time of a cosmetic which comprises admixing pentaerythritol tetra ($C_{20}-C_{24}$) aliphatic

hydrocarbon carboxylate with a conventional cosmetic so that the resulting composition contains from about 2 to 25 weight percent pentaerythritol tetra ($C_{20}-C_{24}$) aliphatic hydrocarbon carboxylate.

We have discovered that incorporation of a sufficient amount of a pentaerythritol tetra ($C_{20}-C_{24}$) aliphatic hydrocarbon carboxylate into a conventional cosmetic base or cosmetic provides long wear lip and eye wear products having advantageous properties compared to commercial products, e.g., lip creams such as "Lip Prime" (Nat Robbins) or "LIP-FIX" cream (Elizabeth Arden) or eye creams such as "EYE-FIX" primer (Elizabeth Arden). The compositions of the present invention adapted for use as a lip cosmetic base and applied to the lips were found effective in controlling, for longer wear times, bleeding and feathering of lipstick applied thereon without interfering with lipstick luster. The compositions of the present invention adapted for use as an eye cosmetic base and applied to the eyelids were found to extend the wear time of eye shadow wear. The eye cream compositions of the present invention are deposited on the eyelids as a tight, even moisturizing film, thereby allowing makeup to be applied thereon smoother and to stay on longer while effectively controlling creasing, color fading and change on the eyelid for longer time periods than conventional commercial compositions.

The cosmetic and cosmetic base compositions of the present invention contain from about 2 to about 25 weight percent, preferably about 5 to 20 weight percent of a pentaerythritol tetra ($C_{20}-C_{24}$) aliphatic hydrocarbon carboxylates. Typical suitable pentaerythritol tetra ($C_{20}-C_{24}$) aliphatic hydrocarbon carboxylates include straight and branched chain ($C_{20}-C_{24}$) alkanoates derived from aliphatic monocarboxylic acids (fatty acids) such as arachidic (C_{20}),

heneicosanoic (C_{21}), behenic (or docosanoic) (C_{22}), tricosanoic (C_{23}) and lignoceric (or tetracosanoic) (C_{24}) as well as mono unsaturated alkenoates such as cis- and trans- Δ^{13} -docosenoic (C_{23}) as well as isoerucic (a mixture of Δ^{14} -docosenoic, ceteloic (Δ^{11} -docosenic) and nervonic (Δ^{15} -tetracosenoic). Surprisingly, the tetra ester of pentaerythritol and C_{18} fatty acids (stearic and oleic acids) do not provide the superior advantages of those included within the scope of the compositions of the present invention. The preferred pentaerythritol tetra(C_{20} - C_{24}) aliphatic hydrocarbon carboxylate is pentaerythritol tetrabeheenate.

The cosmetic compositions of the present invention may be in liquid, solid, or semi-solid form and can be either aqueous or anhydrous. The aqueous compositions adaptable for use as long wear cosmetics and cosmetic bases in the form of an eye cream, a foundation, a mascara or a lip cream, are generally composed of, in addition to the effective amount of a pentaerythritol tetra(C_{20} - C_{24}) aliphatic hydrocarbon carboxylate, an oil-in-water emulsion as found in conventional cosmetic bases. The oil part contains as a major ingredient one or more vegetable, animal and mineral oils, fats, silicones, and waxes, polymers, higher carboxylic acid esters and, as a minor component, color pigments, pearlizing agents, mica, perfume, humectants, sunscreens, surfactants, preservatives, suspending agents, bodying agents and/or antioxidants.

The water used in the aqueous compositions of the present invention is preferably microbially-free, deionized water.

Typical suitable waxes include ozokerite, lanolin alcohol, paraffin wax, bayberry wax, trihydroxystearin, lanolin wax, beeswax, Candellila wax, microcrystalline wax, Carnauba wax, cetyl alcohol,

stearyl alcohol, spermaceti, cocoa butter, fatty acids of lanolin, mono-, di- and triglycerides which are solid at 25°C, fatty esters which are solid at 25°C, silicone waxes such as methyloctadecane-oxypolysiloxane and poly (dimethylsiloxy) stearoxysiloxane, stearyl monoethanolamide, rosin and its derivatives such as the abietates of glycol and glycerol, hydrogenated oils solid at 25°C, and sucroglycerides.

Typical suitable oils include paraffin oil, lanolin, purcellin oil, perhydrosqualene, hydrogenated lanolin, hydroxylated lanolin, acetylated lanolin, petrolatum, castor oil, polybutene, odorless mineral spirits, sweet almond oil, avocado oil, calophyllum oil, ricin oil, horse oil, hog oil, olive oil, castor oil, mineral oil having a boiling point between 310° and 410°C, silicone oil such as dimethylpolysiloxane and cyclomethicone, linoleic alcohol, linolenic alcohol, oleyl alcohol, the oil of cereal germs such as the oil of wheat germ, isopropyl lanolate, isopropyl palmitate, isopropyl myristate, butyl myristate, cetyl myristate, myristyl myristate, myristyl lactate, hexadecyl stearate, butyl stearate, decyl oleate, acetyl glycerides, the octanoates and benzoates of (C₁₂-C₁₅) alcohols, the octanoates and decanoates of alcohols and polyalcohols such as those of glycol and glycerol, ricinoleates of alcohols and of poly alcohols such as those of cetyl alcohol or isostearyl alcohol, isocetyl lanolate, isopropyl adipate, hexyl laurate and octyl dodecanoate. It is preferred to employ a mixture of these oils for their different functions: for example oleyl alcohol is a penetrant and color vehicle; castor oil is a color dispersing agent; mineral oil and cyclomethicone are emollients and moisturizers.

Typical suitable sunscreens include titanium dioxide, and lower alkyl para-methoxycinnamates, and para-aminobenzoates.

Typical suitable antioxidants include propyl, octyl and dodecyl esters of gallic acid, butylated hydroxy anisole, butylated hydroxy toluene and nordihydroguaiaretic acid.

Typical suitable pearlizing agents include bismuth oxychloride, titaniumdioxide-coated mica and crystals of guanine. Generally, the pearlizing agents are dispersed in an oily vehicle.

Typical suitable preservatives include the lower alkyl esters of para-hydroxybenzoates especially the methyl, ethyl, propyl, butyl, and isobutyl esters and mixtures thereof, imidazolidinyl urea, or diazolidinyl urea.

Typical suitable humectants include butylene glycol, propylene glycol, reticulin (the protein) and vitamin E.

Typical suitable surfactants include nonionic, anionic and cationic surfactants such as sorbitan stearate, Oleth-3 phosphate and Quaternium-18, respectively.

Polymers may be used to achieve one or more desirable effects. They may, for example, serve as suspending aids, emulsion stabilizers, emulsification aids, binders, thickeners or film formers, or may provide water resistance, water proofing or gloss. Typical suitable polymers include methylcellulose, hydroxyethyl-cellulose; vinyl polymers and copolymers, e.g., polyvinyl pyrrolidone (PVP) homopolymers and PVP copolymers such as PVP/eicosene copolymer, PVP/hexadecene copolymer; polyvinylacetate (PVA) homopolymers and PVA copolymers; ethylene oxide homopolymers/copolymers and derivatives; and acrylic polymers, e.g., acrylic/acrylate copolymers.

Typical suitable bodying agents include Carbomers especially Carbomer 934P, which are polymers of acrylic acid crosslinked with a polyfunctional agent and available from B.F. Goodrich Chemical Co under the Carbopol tradename; methylcellulose, hydroxyethylcellulose and polyacrylates.

Agents suitable for suspending pigments include magnesium aluminum silicate, polybutene, and Benton Gels, the tradename of N.L. Chemicals, Div. of NL Industries, for a series of modified hectorites (one of montmorillonite minerals that are the principal constituents of bentonite clay).

The compositions of the present invention used in the form of lipstick and eye wear stick may be formulated without water and stiffened to the desired consistency with waxes which also raise the melting point and improve the physical stability.

The compositions of the present invention adaptable for use as cosmetics also include one or more color pigments or coloring materials, e.g., organic dyes and inorganic pigments which are usually dispersed in an oily vehicle.

Typical suitable dyes employed in the cosmetic compositions of the present invention are the U.S. Government certified colors, both Drug and Cosmetic grade and Food, Drug and Cosmetic grade, e.g., D&C reds, oranges, yellows and blues. The pigments employed are generally inorganic pigments such as iron oxides, titanium dioxides, ultramarines, iron sulfides, or other conventional pigments approved for cosmetic use. The dyes and pigments are preferably employed in an amount ranging from about 1% to about 10% by weight of the formulation with about 2% to about 4% being more preferred.

When the cosmetics and cosmetic bases of the present invention are anhydrous, a volatile component is generally used instead of water. Typically suitable volatile components include odorless petroleum distillates, e.g., Shell Sol 71 available from Shell Chemical Co., odorless oil of turpentine, white spirits, volatile silicone oils, e.g., cyclomethicone (cyclic dimethyl polysiloxane), deca- or octa-methylcyclopentasiloxane, ethanol and/or isopropyl alcohol (which also function as a viscosity control agent) and the like.

A typical eyeliner or mascara in the anhydrous form may contain, in addition to the effective amount of a pentaerythritol tetra(C_{20} - C_{24}) aliphatic hydrocarbon carboxylate, one or more volatile components, e.g. isopropyl alcohol, one or more inorganic polymers for thickness, e.g., montmorillonite clay, one or more waxes as viscosity aids, as well as antioxidants, preservatives and processing aids, e.g., dimethicone which is a mixture of fully methylated siloxane polymers end-blocked with trimethylsiloxy units.

The following examples illustrate the invention. Definitions of the ingredients used may be found in the CTFA Cosmetic Ingredients Dictionary, published by The Cosmetic, Toiletry, and Fragrance Association, Inc., 1110 Vermont Avenue, NW, Washington, D.C. 20005, U.S.A. If any ingredients used in these examples are not available, substitutions may be made, since it is believed that the incorporation of pentaerythritol tetra (C_{20} - C_{24}) aliphatic hydrocarbon carboxylate will improve the wear time when formulated into any conventional cosmetic composition.

EXAMPLE I
LONG WEAR EYE CREAM

<u>Ingredients</u>	<u>Parts by Wgt.</u>	
Deionized water	71.55	A
Carbomer 934P ¹	0.20

Butylated Hydroxyanisole	0.10
Methyl p-Hydroxybenzoate	0.10
Pentaerythritol Tetrabehenate	8.00
Octyl p-Methoxycinnamate	2.25
Drometrizole	0.10
Mixture of C ₁₀ -C ₃₀ alkanoate esters of Sterol	2.00

Prepare by mixing the castor oil of Part B with the mica. Pass the mixture so-formed twice through a triple roller mill. Melt all the wax ingredients (Part A) in a steam-jacketed stainless steel kettle equipped with a double motion agitator at a temperature of 85°C and mix until the waxes form a homogenous mixture. Add the mixture of castor oil and mica and the other ingredients of Parts B and C to the homogenous mixture of waxes. Heat the resulting mixture to a temperature of 78°-82°C., while continuously mixing until a uniform dispersion is achieved. The dispersion so formed is poured into molds while maintaining the temperature at 78°-82°C.

The product of Example IV may be used as a base to improve the wear time of conventional lipsticks. Of course, colorants can be added if the product is to color the lips.

¹ A self-emulsifying grade of the ester of glycerine and stearic acid, which contains some sodium and/or potassium stearate.

Prepare by dispersing Carbomer 934P in water (Part A) until complete hydration is achieved. Heat the mixture so formed to 75°C and add a mixture of glycerine and methyl p-hydroxybenzoate (Part B). Add cyclomethicone (Part C) to the oil phase (Part D) prior to emulsification, (a temperature of 80°C). Heat, with mixing, all the ingredients (Parts C and D) to 85°C until a uniform dispersion is achieved. Add the oil phase (Parts C and D) to water phase (Parts A and B) and mix as the temperature is lowered to 70°C. Add Part E and continue mixing as temperature is lowered to 60°C. Add Part F and continue mixing. Cool the mixture to 40°C and add thereto Part G.

-19-

COMPARATIVE EXAMPLE XLIP REPAIR CREAM

<u>Ingredients</u>	<u>Parts by Wgt.</u>

¹ A mixture of Lecithin and Polysorbate 20^a and sorbitan laurate and propylene glycol stearate and propylene glycol

laurate available from American Lecithin Co., Inc., Atlanta Georgia, U.S.A.

(a) A mixture of laurate esters of sorbitol and sorbitol anhydrides, consisting predominantly of the monoester, condensed with approximately 20 moles of ethylene oxide.

2 A mixture of red and yellow iron oxides, talc, titanium dioxide, ultramarine blue and kaolin.

3 The disodium salt of the monooleyl amide of the diethylene glycol half-ester of sulfosuccinic acid anhydride, available from Witco Chemical Corp., Organics Div., N.Y., N.Y., U.S.A.

Prepare by heating the ingredients in Part A, with mixing, to a temperature of 80°C. Add the ingredients of Parts B, C and D and continue mixing until a uniform dispersion is achieved. Add the color mix of Part E. Pass the mixture so formed through a colloid mill and add water of Part E. Add Part F and reheat the so-formed mixture to 80°C. In a steam-jacketed kettle equipped with an agitator, heat the oil phase (Part G) to 80°C. Add, with mixing, the oil phase and Part H to the mixture of Parts A to F while maintaining the temperature at 80°C. Cool mixture so formed to 60-66°C. Cool mixture so formed to 50-55°C and add Parts I and J.

CLAIMS

1. A composition adaptable for use as a long wear cosmetic base or as a long wear cosmetic comprising from about 2 to about 25 weight percent of a pentaerythritol tetra(C₂₀-C₂₄) aliphatic hydrocarbon carboxylate in a conventional cosmetic or cosmetic base.
2. The cosmetic composition of claim 1 wherein the aliphatic hydrocarbon carboxylate groups have straight chains.
3. The cosmetic composition of claim 2 wherein the aliphatic hydrocarbon carboxylate groups are alkanoates.
4. The cosmetic composition of claim 3 wherein said pentaerythritol alkanoate is pentaerythritol tetrabehenate.
5. The cosmetic composition of any one of claims 1 to 5 which contains about 5 to about 20 weight percent of pentaerythritol tetra(C₂₀-C₂₄) aliphatic hydrocarbon carboxylate.
6. A composition of any one of claims 1 to 5 adapted for use as a long wear cosmetic base.
7. A composition of anyone of claims 1 to 5 adapted for use as a long wear eye cream, long wear lip cream, long wear lipstick, long wear eye wear stick, long wear eyeliner, long wear mascara or long wear foundation.
8. A method of extending the effective wear time of a cosmetic comprising admixing pentaerythritol tetra (C₂₀-C₂₄) aliphatic hydrocarbon carboxylate with a conventional cosmetic or cosmetic base so that the resulting composition

-23-

contains from about 2 to about 25 weight percent pentaerythritol tetra (C₂₀-C₂₄) aliphatic hydrocarbon carboxylate.

9. The method of claim 8 wherein the conventional cosmetic base in an eye cream, lip cream, lipstick, eye wear stick, eyeliner, mascara, or foundation.

10. The method of claims 8 or 9 wherein the aliphatic hydrocarbon carboxylate groups have straight chains.

11. The method of claims 8 or 9 wherein the aliphatic hydrocarbon carboxylates are alkanoates.

12. The method of claim 11 wherein the pentaerythritol alkanoate is pentaerythritol tetrabeheenate.
